Data entry problems impede clinical trial efficiency and cost effectiveness for sites and sponsors

TODAY'S CHALLENGES	FACTS AND FIGURES
Burden & complexity of **data capture** is increasing	Late stage trials typically use **3X more** data vs. 10 yrs ago[1]
Data **quality assurance** is costly & time consuming	Data management represents **25-40% of overall trial costs**[2]
Staffing shortages & turnover impede research	**63% of sites** list staff retention as a top concern[3]
Manual data entry is prevalent & resource intensive	**74% of sites** still use paper for source data collection

EHR-to-EDC technology **automates data transfer between systems**, leading to **faster data entry, improved data accuracy**, and **reduced site burden**.

Recent research shows a substantial portion of oncology trial data is eligible for EHR-to-EDC transfer

BACKGROUND:
This study describes the availability of data eligible for EHR-to-EDC transfer across a portfolio of oncology trials.

METHODS:
Five oncology studies were selected to represent diverse phases and disease types; data volume by element/field was ascertained for each, and data elements were reviewed for EHR-to-EDC transfer eligibility.

RESULTS:
Across 5 diverse oncology trials, **86% (n = 15799) of collected data points were eligible for EHR-to-EDC transfer**.

Volume of Patient Data Elements and Proportion Eligible for EHR-to-EDC Transfer

Study Phase	Disease	No.	%
		Total collected	Eligible for transfer
I	Acute myeloid leukemia	2813	87
III	Breast cancer	3175	85
II	Gastric cancer	2063	81
III	Lung cancer	7180	87
I/II	Multiple myeloma	3207	86
Total		**18438**	**86**

Flatiron Clinical Pipe™ captures more data than other tools, including trial-specific and unstructured data

42,132

Data points collected across 82 patients for 12 month active enrollment period[1]

92%

Clinical Pipe eligible data[1]

Example Trial Data Source Breakdown

1 Routinely Captured **Structured** Data

Routinely captured data with high completeness & quality via EHR integration

2 Trial-Specific **Structured** Data

Industry-first, EHR-embedded trial-specific capture

3 **Unstructured** Data

Proprietary unstructured data capabilities to supplement structured data

[1]Internal analysis of Clinical Pipe usage across 12 months in Multiple Myeloma clinical trial at 4 sites with Top 5 pharma company

Clinical Pipe™ supports 90+ research sites across academic and community healthcare settings

Sites using Clinical Pipe™ complete fewer time-intensive, duplicative data entry tasks

- Enables sites to spend **more time on protocol adherence** and **taking care of patients**
- **Reduces** the number of **queries** and **onsite monitoring visits**
- **Free for sites** to use and **does not commercialize data**
- Only requires a **one-time set-up and contracting**, after which sites may use on any future Flatiron Clinical Pipe-enabled protocol
- Onboarding and ongoing usage supported via **1:1 trainings, group trainings, onsite and virtual support, and dedicated email support**

[This study] is the easiest study for me to do data entry for... Clinical Pipe™ helps reduce transcription errors. It's been great… I would like it for all of my studies…"

Sanofi deployed Clinical Pipe™ to transfer data for Phase I oncology studies

Existing Partnership Overview

- Sanofi began using Flatiron Clinical Pipe in 2023 for routinely-collected structured data to enable a reduction in time and costs associated with both manual, high-volume data entry and downstream data resolution issues for sites
- Clinical Pipe has supported **two oncology trials** (one ongoing, one closed), with more planned to follow
- The evidence from the closed study indicated that using Clinical Pipe even for the limited scope of structured data provided the below benefits:
  - **Over 2.2K data points transferred** during pilot
  - An average of **1 hour of time savings** per patient visit on laboratory data entry alone
  - **~90% query reduction** compared to data entered manually at other sites for these forms
  - More time back for study coordinators to **focus on entering complex data types** (AEs, SAEs, etc.)

Flatiron Health Embarks on Strategic Collaboration with Sanofi to Make Clinical Trials More Efficient by Streamlining Data Acquisition at the Point of Care

Optimizing Data Collection: Assessing EHR-to-EDC Data Transfer Potential Across Structured and Unstructured Data

flatiron

Key takeaways from Sanofi's Clinical Pipe implementation

Set-up and testing the integration of Clinical Pipe presented **minimal impact** to the Sanofi study teams

Clinical Pipe's **flexible mapping** supported Sanofi's requirement that the eCRF **not require special fields or redesign**

With **ongoing support and training**, site acceptance of Clinical Pipe was encouraging

Leveraging standard forms paired with the associated mappings **enhances reusability across studies** and **increases efficiency of use** for new study teams and trials

Common challenges impacting site adoption

OVERLOAD OF TECH TOOLS

55% of sites[3] listed supporting various tools as a top concern when participating in tech enabled clinical trials

STAKEHOLDER MISALIGNMENT

95% of sponsors believe sites value their software, but only **62.5% of sites**[2] feel that sponsors adequately address their technology needs.

RESOURCE ALLOCATION

Sites are **juggling requests** for implementations, troubleshooting, and other tasks that **strain their internal resources**.

CONTRACTING AND BUDGETING

43% of sites[3] listed financial compensation as a significant barrier to participating in a tech-enabled trial.

WORKFLOW DISRUPTION

76% of sites[1] rank **sponsor willingness to integrate** with their systems as their top technology expectation.

PRIVACY AND LEGAL REVIEWS

For each new technology, sites must undertake privacy and legal reviews that **extend contracting and startup timelines**.

Poll #2

What additional barriers to site adoption have you encountered?

flatiron

Strategies to overcome site adoption challenges

Explore paths to **standardize budget and contracting** and **support technology reimbursement**

Partner with sites to identify areas for technological investment and to review potential vendors

Select technology **that integrates with sites' current tech and processes**

Work with vendors to support **initial training** and **ongoing support and retraining** for sites
